Q: Injecting object in constructor - Best practice I am having a couple of classes where one of the classes needs the object injected in constructor. I am just wondering if the following is a good practice or bad practice. When I inject an object in the constructor of a class, if the class is used as a dependency, the constructor is not really called so it is not really an instantiation. However if I inject the object in the class' interface, it seems like I am not really using the class in the right way. Is there a better way to do it? A: I think there's nothing wrong with injecting an object into a class constructor if the class itself is the object. As you say, this isn't really instantiating it. That said, if you make a class interface, there should be no reason for you to inject any objects into it. If anything, you should be exposing these interfaces through your class as public properties, then injecting the implementations behind the interfaces into the classes which actually depend on them. That way, if you were to use the interface in a different class, it would just need to get the implementation for itself, rather than being dependent on its existence. Q: Cross-Domain ajax call in jquery I am using jquery. I am sending post data to an api url. On the other side i am checking if the call is cross-domain or not. function postCall(){ 82157476af
